

Sakinah — Build Brief

Your scope and the rules. The “how” is yours to figure out.

What you are building

Sakinah · Shukr Mode — the character-first Islamic marriage journey described in your foundation document and prototype. You build it **from the ground up**: the screens, the backend, the data, the logic. This brief gives you the boundary and the rules — not the method.

Where it plugs in

- **Frontend**: a new *features/sakinah/* module inside the existing app you were given. Reuse its auth, routing, Firebase config, and design system. **Do not touch the existing Connections feature.**
- **Backend**: a new **Python + FastAPI** service that you write. The frontend reaches it via the *VITE_BACKEND_URL* already in the env file.
- **Data**: your own Firestore collections in your throwaway Firebase project.

Non-negotiable rules

- **Server-authoritative.** The backend verifies the Firebase Auth token and **owns every sensitive write** (matches, signals, safety, verification status). Clients must never write match or safety data, and never decide who is shown. Hiding it in the UI is not enough — it must be impossible from the client.
- **Backend stack is Python + FastAPI.** Not negotiable.
- **No production access.** Work only against your own throwaway Firebase project.
- **No real identity data in development.** Use the KYC sandbox only (see the KYC brief).
- **No AI / Claude / OpenAI keys.** Raya is **scripted** for v1. Do not add paid AI calls.
- **Honour the product’s own “must never” list:** no swipe, no feed, no public profiles, no photo before mutual interest, no rejection notifications, no “riya engine” (worship/gratitude/community never feed matching). Character-first, women-first safety.

Provided to you (your prerequisites)

You are given	You build
Running app shell (frontend) · Firebase Auth · Firestore (dev project) · Admin credentials · KYC vendor sandbox credentials · design system	The <i>features/sakinah/</i> UI · the FastAPI service · the data model · matching logic · the KYC integration · liveness flow · seed data · Raya scripting · safety/moderation

Delivering your work

You do not have repository access. Hand back a **patch or a zip of only the files you changed**. Never include secrets, *node_modules*, or service-account keys.

On purpose, this brief does not tell you how

The architecture, the data model, the vendor integration, and the build order are **yours to design**. Use your foundation document and prototype as the spec. Ask only when a **boundary or a rule** above is unclear.
